Level 1 Practice: Importing Excel Data from a Single Worksheet

Practice Quiz • 20 min • 1 total point

1. In this practice, you create a table that contains a copy of the data that is in an Excel workbook. The Excel workbook contains a single worksheet. If necessary, start SAS Studio ⧉ before you begin.

   1. Open **p102p01.sas** from the **practices** folder. Complete the PROC IMPORT step to read **eu_sport_trade.xlsx**. Be sure the replace FILEPATH with the path to your **EPG1V2/data** folder. Create a SAS table named **eu_sport_trade** and replace the table if it exists.

   2. Modify the PROC CONTENTS code to display the descriptor portion of the **eu_sport_trade** table.

   3. Submit the program, and then view the output data and the results. How many variables are in the **eu_sport_trade** table?

   > 6

   ✓ **Correct**
   The table has six variables: **Amt_Export**, **Amt_Import**, **Country**, **Geo_Code**, **Sport_Product**, and **Year**.

   ```
   proc import datafile="FILEPATH/eu_sport_trade.xlsx"
               dbms=xlsx
               out=eu_sport_trade
               replace;
   run;
   ```
